Autodesk's AutoCAD development efforts started in 1980, and the product was first released in 1982. History In 1980, Autodesk launched a project to develop a commercial CAD

system using a new technology. The initial idea was to create a system that could be used on a minicomputer, similar to the early commercial CAD systems that ran on mainframe computers or minicomputers. This concept was merged with a student project that was working on a 3D graphics system for a personal computer. For the student project, Autodesk needed a 3D graphics

system to complement the architecture they were working on. The company's existing software company, Art Technology, had a group of artists who were interested in computer graphics, and they volunteered to help with the project. After several months of work, the team developed a CAD application that used a generic geometry engine to create objects and manipulate

them in 3D space. This effort was referred to as the "Geometric Engine" project.

In 1981, the "Geometric Engine" team was disbanded, and Autodesk took over the project. The "Geometric Engine" team had produced several working versions of the 3D CAD software that could handle simple geometric elements and objects.

However, due to the limitations of the

minicomputer hardware, the product was not able to handle complex, high-detail geometry at an acceptable speed. After realizing that a new type of hardware was needed to develop the CAD software, Autodesk decided to approach the hardware company that had helped develop the original CAD system: Mathieu Leblanc.

Leblanc realized that Autodesk needed a new kind of graphics hardware to

handle the complex geometry of their CAD system. The first version of the 3D graphics hardware was created by Leblanc using video cards that were originally intended to handle the generation of simple image textures. The first product to use the 3D graphics hardware was the "Drawing Board" suite of products, which included the "Drawing Board" and the "Drawing Board 2" products.

Both products were released in 1982, and the Drawing Board used a color graphics card while the Drawing Board 2 used a monochrome graphics card. The company that created the hardware, Eltron, had created the "DRAWmate" line of products at the time. The DRAWmate line of graphics boards was compatible with several existing Eltron products, and Autodesk used several of

these

What's New in the AutoCAD?

New Start and Help: A new Start screen. Quickly locate answers with the Quick Links panel. Improved Navigation: Use Arrange, Format and Link to quickly navigate through objects in your drawings. Style Editor: Create styles with properties based on a drawing's graphic style and use these styles to quickly apply, edit, or link to any style. For example, use the new feature to easily change line

cap type and thickness.

Graphical Modeling (GM): A
new capability that
visualizes a model as a
composition of hierarchies
and relationships. Make
changes to objects in the
model and automatically
propagate those changes to

related objects. (video: 3:30 min.) Content-aware fill and mask: Fill objects based on a pattern, shape, or color, or select which parts of an object to fill. (video: 3:40 min.) Spatial and Dynamic Modeling: Take advantage of the benefits of Visual Programming with the new Spatial Modeling and Dynamic Modeling tools. (video: 3:15 min.) Support for Structural Frame-Based Programming: Add and edit

frames to your drawings quickly and easily with the Frame Properties dialog box and frame editing tools. (video: 1:30 min.) Video: Design by Contract AutoCAD® 2023 adds support for Design by Contract (DBC) technology, allowing you to document more information about your drawing and help identify your drawing's design intent and risks. With Design by Contract, you can help your

colleagues understand your intent by including the requirements and your notes on the documentation in your drawing. The Design by Contract standard, established by the Unified Modeling Language (UML), is the most common method of documenting the requirements and design intent of computer programs. Design by Contract helps programmers better understand how

programs are supposed to work. It also helps programmers understand how they have designed their programs, so they can improve their designs and make the programs more flexible. Some of the documents you might use with Design by Contract are UML models, requirements documentation, and change requests. The Design by Contract standard is primarily
